

# Programming Language Concepts, cs2104 Lecture 06 (2003-09-19)

**Seif Haridi**

Department of Computer Science,  
NUS

[haridi@comp.nus.edu.sg](mailto:haridi@comp.nus.edu.sg)

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

1

## Overview

- Abstract machine: summary from last lecture
  - procedures
  - Examples done in the tutorial
- Properties of abstract machine
  - memory management
  - last call optimization
  - higher-order programming
- Mapping Full Syntax to Kernel Syntax
- Introduction to declarative programming (Chapter 3)
- Iterative computations

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

2

# Concepts

- Single-assignment store
- Environment
- Semantic statement
- Execution state
- Computation

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

3

# Summary

- Semantic statement executes by
  - popping itself always
  - creating environment `local, proc, {...}`
  - manipulating store `local, =`
  - pushing new statements `local, if, {...}`  
sequential composition
- Semantic statement can suspend
  - activation condition `if, case, {...}`
  - suspend until store is updated

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

4

# Procedures

- Calling procedures
  - to what do variables refer to?
  - how to pass parameters?
  - how about external references?
  - where to continue execution?
- Defining procedures
  - how about external references?
  - when and which variables matter?

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

5

# Identifiers in Procedures

```
proc {P X Y}  
  if X>Y then Z=1 else Z=0 end  
end
```

- X and Y are called *(formal) parameter*
- Z is called *external reference*
- More familiar variant

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

6

## Free and Bound Identifiers

```
local z in
  if x>y then z=1 else z=0 end
end
```

- X and Y are *free variable identifiers* in this statement (declared outside)
- Z is a *bound variable identifier* in this statement (declared inside)

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

7

## Free and Bound Identifiers

```
local z in
  if x>y then z=1 else z=0 end
end
```

Declaration Occurrence

- X and Y are *free variable identifiers* in this statement (declared outside)
- Z is a *bound variable identifier* in this statement (declared inside)

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

8

## External References

```
proc {P X Y}  
  if X>Y then Z=1 else Z=0 end  
end
```

- The external references are the free identifiers of the procedure body (here Z)

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

9

## Obs!

- Do not confuse  
    *bound occurrences of identifiers*  
and  
    *bound identifiers*  
with  
    *bound variables*

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

10

## Lexical Scoping

```
local z in
  z=1
  proc {P X Y} Y=X+Z end
end
```

- External references take values when definition is executed
- Is defined statically and visible in program (“lexical”)
- Mapping is done by environment

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

11

## Contextual Environment

- When defining procedure, construct *contextual environment*
  - maps all external references...
  - ...to values at time of definition
- Procedure definition creates procedure value
  - pair of procedure and contextual environment
  - value is written to store

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

12

# Procedure Call

- Values for
  - external references
  - actual parametersmust be available to called procedure
- As usual: construct new environment
  - start from contextual environment for external ref
  - adjoin actual parameters

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

13

# Summary

- Procedure values
  - go to store
  - combine procedure body and contextual environment
  - contextual environment defines external references
  - contextual environment defined by lexical scoping
- Procedure call
  - checks for the right type
  - passes arguments by environments
  - contextual environment for external references

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

14

## Discussion

- Procedures take the values upon definition
- Application automatically restores them
- Not possible in Java, C, C++
  - procedure/function/method just code
  - environment is lacking
  - Java: need an object to do this (with inner classes)
  - one of the most powerful concepts in computer science
  - pioneered in Algol 68

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

15

## Summary

- Procedures are values as anything else!
- Allows breathtaking programming techniques
- With environments it is easy to understand what is the value for an identifier

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

16

# Higher-order Programming

## Short Appetizer

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

17

## Generic Procedures

- **Sorting a list**
  - in increasing or decreasing order
  - by number or phone book order (lexicographic order)
  - sorting algorithm + order
- **Mapping a list of numbers**
  - to list of square numbers
  - to list of inverted numbers
  - to list of square roots
  - ...

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

18

## Mapping to Squares

```
fun {MapSq Ns}
  case Ns
  of nil then nil
  [] N|Nr then N*N|{MapSq Nr}
  end
end
{Browse {MapSq [1 2 3]}}
```

- Tedious, for each different mapping procedure the entire recursion!

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

19

## List Mapping

- Mapping
  - each element recursively
  - *calling function for each element*
  - construct list that takes output
- Separate function calling by passing function as argument

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

20

## Map

```
fun {Map Xs F}
  case Xs
  of nil then nil
  [] X|Xr then {F X}|{Map X Fr}
  end
end
fun {Sq X} X*X end
{Browse {Map [1 2 3] Sq}}
```

- Use Map for any mapping function!

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

21

## Higher-order Programming

- Use of procedures as first-class values
  - can be passed as arguments
  - can be constructed at runtime
  - Can be stored in data structures
  - procedures are simply values!
- Will present a number of programming techniques using this idea

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

22

# Properties of Abstract Machine

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

23

## What Can We Use AM for?

- Proving properties
- Understanding runtime
- Understanding memory requirements
- AM is a *model* for computation
  - implementations will refine model

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

24

## Exploiting the Abstract Machine

- We can prove:  
    `local x local y in <s> end end`  
    executes the same as  
    `local y local x in <s> end end`
- We can prove properties of our programs

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

25

## Exploiting the Abstract Machine

- We can define runtime of a statement `<s>`
  - the number of execution steps to execute `<s>`
- We can understand how much memory execution requires
  - semantic statements on the semantic stack
  - number of nodes in the store
- What is really in the store?

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

26

# Garbage Collection

- A store variable  $x$  is *life*, iff
  - a semantic statement refers to  $x$  (occurs in environment), or
  - there exists a life store variable  $y$  and  $y$  is bound to a data structure containing  $x$
- All data structures which are not life can be safely removed by *garbage collection*
  - happens from time to time

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

27

# Last Call Optimization

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

28

## How Does Recursion Work?

```
local P in
  P = proc {$} {P} end
  {P}
end
```

- Program will run forever
- Contextual environment of P will map P to procedure value
- Let us try this example

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

29

## Recursion at Work

```
((local P in
  P = proc {$} {P} end
  {P}
end, Ø)],
Ø)
```

- Initial state

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

30

## Recursion at Work

$$([ (P = \text{proc } \{\$ \} \{P\} \text{ end } \{P\}, \\ \{P \rightarrow p\})], \\ \{p\})$$

- After execution of `local`

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

31

## Recursion at Work

$$([ (P = \text{proc } \{\$ \} \{P\} \text{ end}, \{P \rightarrow p\}), \\ (\{P\}, \{P \rightarrow p\})], \\ \{p\})$$

- After execution of sequential composition

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

32

## Recursion at Work

$([(\{P\}, \{P \rightarrow p\})],$   
 $\{p = (\text{proc } \{\$ \} \{P\} \text{ end}, \{P \rightarrow p\})\})$

- After execution of procedure definition
  - external reference of body of P:  $P$
  - contextual environment:  $\{P \rightarrow p\}$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

33

## Recursion at Work

$([(\{P\}, \{P \rightarrow p\})],$   
 $\{p = (\text{proc } \{\$ \} \{P\} \text{ end}, \{P \rightarrow p\})\})$

- After execution of procedure definition
  - external reference of body of P:  $P$
  - contextual environment:  $\{P \rightarrow p\}$
- Environment creates self reference

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

34

## Recursion at Work

```
([( {P}, {P→p} )],  
  {p=(proc { $ } {P} end, {P→p})})
```

- Will continue forever
- Stack will never grow!
- Runs in constant space
  - called *iterative computation*

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

35

## Another Spinning Program

```
local Q in  
  Q = proc { $ } {Q} {Q} end  
  {Q}  
end
```

- Program will run forever
- Contextual environment of Q will map Q to procedure value

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

36

## Some Steps...

$([(\{Q\}, \{Q \rightarrow q\})],$   
 $\{q = (\text{proc } \{\$ \} \{Q\} \{Q\} \text{ end}, \{Q \rightarrow q\})\})$

- After execution of
  - local
  - sequential composition
  - procedure definition

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

37

## Procedure Call (1)

$([(\{Q\}, \{Q \rightarrow q\}),$   
 $(\{Q\}, \{Q \rightarrow q\})],$   
 $\{q = (\text{proc } \{\$ \} \{Q\} \{Q\} \text{ end}, \{Q \rightarrow q\})\})$

- After execution of procedure call
  - no arguments
  - new environment is the same  
contextual environment + argument  
environment

$\{Q \rightarrow q\}$

$\{\}$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

38

## Procedure Call (2)

```
([({Q}, {Q→q}),  
  ({Q}, {Q→q}),  
  ({Q}, {Q→q})],  
 {q=(proc {$} {Q} {Q} end, {Q→q})})
```

- Stack grows with each step!

## Recursion: Summary

- Iterative computations run in constant space
- Also called: last call optimization
  - no space needed for last call in procedure body

## Two Functions...

```
fun {SADD N M}  
  %% returns  $N+M$  for positive  $N$   
  if N==0 then M else 1+{SADD N-1 M} end  
end
```

```
fun {FADD N M}  
  %% returns  $N+M$  for positive  $N$   
  if N==0 then M else {FADD N-1 M+1} end  
end
```

## Questions

- Which one is faster?
- Which one uses less memory?
- Why?
- How?

## Answers...

- Transform to kernel language
- See, how they compute
- Answer the questions

## Procedure: SADD

```
proc {SADD N M NM}  
  if N==0 then NM=M  
  else local N1 in  
    N1=N-1  
    local NM1 in  
      {SADD N1 M NM1}  
      NM=1+NM1  
    end  
  end  
end  
end
```

## Procedure: SADD

```
proc {SADD N M NM}  
  if N==0 then NM=M  
  else local N1 in  
    N1=N-1  
    local NM1 in  
      {SADD N1 M NM1}  
    NM=1+NM1  
  end  
end  
end  
end
```

procedure call  
after recursive  
call

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

45

## How Does SADD Compute?

```
local X Y Z in  
  X=4 Y=3  
  proc {SADD ...} ... end  
  {SADD X Y Z}  
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

46

## Sketch for SADD

$([(\{SADD\ X\ Y\ Z\}, \dots)], \dots) \rightarrow$

$([(\{SADD\ N1\ M\ NM1\}, \dots),$   
 $(NM = 1 + NM1, \dots)], \dots) \rightarrow$

$([(\{SADD\ N1\ M\ NM1\}, \dots),$   
 $(NM = 1 + NM1, \dots)$   
 $(NM = 1 + NM1, \dots)], \dots) \rightarrow \dots$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

47

## Procedure: FADD

```
proc {FADD N M NM}
  if N==0 then NM=M
  else local N1 in local M1 in
    N1=N-1
    M1=M+1
    {FADD N1 M1 NM}
  end end
end
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

48

## Procedure: FADD

```
proc {FADD N M NM}
  if N==0 then NM=M
  else local N1 in
    N1=N-1
    M1=M+1
    {FADD N1 M1 NM}
  end end
end
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

49

## Sketch for FADD

```
((({FADD X Y Z}, ...)), ...) →
((({FADD N1 M1 NM}, ...)), ...) →
((({FADD N1 M1 NM}, ...)), ...) →
((({FADD N1 M1 NM}, ...)), ...) → ...
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

50

## SADD versus FADD

- SADD uses stack space depending on its argument
- FADD uses constant stack space
  - iterative computation
  - thanks to last call optimization
- Techniques for achieving iterative computations: accumulators (later)

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

51

## Full Syntax to Kernel Syntax

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

52

## Statements and Expressions

- Expressions describe computations that return a value
- Statements just describe computations
- Kernel language
  - only expressions allowed: value construction
  - otherwise only statements

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

53

## Abbreviations for Declarations

- Kernel language
  - just one variable introduced
  - no direct assignment
- Programming language
  - several variables
  - variables can be also assigned when introduced
  - infinite scope: declare

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

54

## Transforming Declarations Multiple Variables

```
local X Y in  
  <statement>  
end  
      ⇒  
local X in  
  local Y in  
    <statement>  
  end  
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

55

## Transforming Declarations Direct Assignment

```
local  
  X=<expression>  
in  
  <statement>  
end  
      ⇒  
local X in  
  X=<expression>  
  <statement>  
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

56

## Interactive Statements

- `declare` also introduces variable identifiers
- Does not have an end part as `local`
  - further statements can use previous identifiers

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

57

## Transforming Expressions

- Unfold function calls to procedure calls
- Use local declaration for intermediate values
- Order of unfolding:
  - left to right
  - innermost first
  - watch out: different for record construction (later)

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

58

## Function Call to Procedure Call

$X = \{F \ Y\} \Rightarrow \{F \ Y \ X\}$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

59

## Unfolding Nested Calls

$\{P \ \{F \ X \ Y\} \ Z\} \Rightarrow$   
 $\begin{array}{l} \text{local } U1 \text{ in} \\ \quad \{F \ X \ Y \ U1\} \\ \quad \{P \ U1 \ Z\} \\ \text{end} \end{array}$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

60

## Unfolding Nested Calls

```
{P {F {G X} Y} Z}  ⇒  local U2 in
                        local U1 in
                          {G X U1}
                        end
                        {F U1 Y U2}
                        {P U2 Z}
                      end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

61

## Unfolding Conditionals

```
if X>Y then
  ...
else
  ...
end

local B in
  B = (X>Y)
  if B then
    ...
  else
    ...
  end
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

62

## Expressions to Statements

```
X = if B then
  ...
else
  ...
end
```

⇒

```
if B then
  X = ...
else
  X = ...
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

63

## Length (0)

```
fun {Length Xs}
  case Xs
  of nil then 0
  [] x|Xr then 1+{Length Xr}
  end
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

64

## Length (1)

```
proc {Length Xs N}  
  N=case Xs  
    of nil then 0  
    [] x|Xr then 1+{Length Xr}  
  end  
end
```

- Make it a procedure

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

65

## Length (2)

```
proc {Length Xs N}  
  case Xs  
  of nil then N=0  
  [] x|Xr then N=1+{Length Xr}  
  end  
end
```

- Expressions to statements

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

66

## Length (3)

```
proc {Length Xs N}
  case Xs
  of nil then N=0
  [] X|Xr then
    local U in
      {Length Xr U}
    N=1+U
  end
end
end
```

- Unfold function call

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

67

## Length (4)

```
proc {Length Xs N}
  case Xs
  of nil then N=0
  [] X|Xr then
    local U in
      {Length Xr U}
      {Number.'+' 1 U N}
    end
  end
end
end
```

- Replace operation (+, dot-access, <, >, ...): procedure!

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

68

## Summary

- Transform to kernel language
  - function definitions
  - function calls
  - expressions
- Kernel language
  - procedures
  - declarations
  - statements

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

69

## Most Important Concepts

- Single-assignment variables
  - partial values
- Abstract machine
  - a *tool* for understanding computations
  - a *model* of computation
  - based on environments
  - supports last call optimization
- Procedures with contextual environment

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

70

# Abstract Machine

- General approach to explain how programming language computes
  - **model** for computation
- Can serve as base for implementation
  - pioneered by Prolog D.H.D. Warren, 1980's
  - many other languages including Oz
  - recent: JVM (Java) SUN
  - CLR (C#, ...) Microsoft

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

71

# Goal

- Programming as an engineering/scientific discipline
- An engineer can
  - understand abstract machine
  - apply programming techniques
  - develop replicate approach with abstract machine
  - programs and techniques

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

72

# Outlook

- Next 2 lectures: programming techniques
  - iterative and recursive computations
    - accumulators
    - type notation
  - partial data structures
    - FIFO queues
  - higher-order programming
  - abstract data types
  - modules and interfaces

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

73

# Declarative Programming

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

74

# Declarative Programming

- We are exploring declarative programming
  - declarative programming model
  - declarative programming techniques
- We used “declarative” variables for single-assignment variables

...what does **declarative** mean?

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

75

## Declarative means...

- Programs returns  
    **same result**  
for  
    **same arguments**
- Always, always, always...  
    regardless of any other computations

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

76

# Declarative Programming Properties

- Independence
  - write programs independently
  - test and debug independently
  - other components of program do not matter
- Simple reasoning
  - declarative programs only compute values
  - no hidden state, no history, ...
- This means simple development...

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

77

# Is Everything Declarative?

- No, it is not...
  - ...there is no silver bullet
- Why bother then?

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

78

## Be as Declarative as You Can

- Many program components can be written in a declarative style
  - use the benefits as much as possible
- For the rest, use other techniques
  - concurrency
  - state
  - objects

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

79

## Significance

- Some languages are better than others at declarative programming (Oz versus C++)
- Declarative programming techniques are useful whatever language you program in
  - this course wants to sharpen your mind
  - this course uses a language that is good at declarative programming and the other techniques to come

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

80

# Iterative Computations

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

81

## Reminder: Iterative Computations

- Iterative computations run with **constant stack space**
- Make use of last optimization call
- Tail recursive procedures are computed by iterative computations

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

82

## Iterative Computations: Examples

- FADD Shown earlier
- Append
- FastLength
  - some lectures ago...

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

83

## Structure of Iterative Computations

- Iterative programs follow structure
  - start from initial state
  - while condition `IsDone` on state is false: repeat with transformed state

$S_0 \rightarrow S_1 \rightarrow \dots \rightarrow S_n$

```
fun {Iterate  $S_i$ }  
  if {IsDone  $S_i$ } then  $S_i$   
  else  $S_{i+1}$ ={Transform  $S_i$ } in {Iterate  $S_{i+1}$ }  
  end  
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

84

## How to Make Use of Structure

- Design the following parts
  - what is a state
  - when to stop: `IsDone`
  - how to transform: `Transform`
- After you have done this, attempt an implementation
  - what are techniques for implementation...
  - way to structure our design

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

85

## An Example...

- The book has a very good example for computing square roots with the Newton-Raphson method
  - you **must** read this

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

86

# Making Computations Iterative

## Accumulators

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

87

## What If Computations Not Iterative?

- Quite often, we can make them iterative
- Technique: accumulator
- Examples
  - computing the power function
  - reversing a list
  - list separation: minimum element, all greater elements

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

88

## Power Function: Inductive Definition

- We know (from school or university)

$$x^n = \begin{cases} 1 & , \text{ if } n \text{ is zero} \\ x \times x^{n-1} & , \text{ otherwise} \end{cases}$$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

89

## Recursive Function

```
fun {Pow X N}  
  if N==0 then 1  
  else X*{Pow X N-1}  
  end  
end
```

- Is not tail-recursive
  - not an iterative function
  - uses stack space in order of  $N$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

90

## How Does Pow Compute?

- Consider  $\{\text{Pow } 5 \ 3\}$ , schematically:

$$\begin{aligned}\{\text{Pow } 5 \ 3\} &= \\ 5 * \{\text{Pow } 5 \ 2\} &= \\ 5 * (5 * \{\text{Pow } 5 \ 1\}) &= \\ 5 * (5 * (5 * \{\text{Pow } 5 \ 0\})) &= \\ 5 * (5 * (5 * 1)) &= \\ 5 * (5 * 5) &= \\ 5 * 25 &= \\ 125 &= \end{aligned}$$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

91

## Better Idea for Pow

- Take advantage of fact that multiplication can be reordered

$$\begin{aligned}\{\text{Pow } 5 \ 3\} * 1 &= \\ \{\text{Pow } 5 \ 2\} * (5 * 1) &= \{\text{Pow } 5 \ 2\} * 5 = \\ \{\text{Pow } 5 \ 1\} * (5 * 5) &= \{\text{Pow } 5 \ 1\} * 25 = \\ \{\text{Pow } 5 \ 0\} * (5 * 25) &= \{\text{Pow } 5 \ 0\} * 125 = \\ &1 * 125 \\ &= 125\end{aligned}$$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

92

## Better Idea for Pow

- Take advantage of fact that multiplication can be reordered

$$\begin{aligned} \{ \text{Pow } 5 \ 3 \} * 1 &= \\ \{ \text{Pow } 5 \ 2 \} * (5 * 1) &= \{ \text{Pow } 5 \ 2 \} * 5 = \\ \{ \text{Pow } 5 \ 1 \} * (5 * 5) &= \{ \text{Pow } 5 \ 1 \} * 25 = \\ \{ \text{Pow } 5 \ 0 \} * (5 * 25) &= \{ \text{Pow } 5 \ 0 \} * 125 = \\ &1 * 125 \\ &= 125 \end{aligned}$$

- Technique: **accumulator** for intermediate result

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

93

## Using Accumulators

- Accumulator stores intermediate result
- Finding an accumulator amounts to finding a state invariant
  - state invariants is a property that is valid on all states
  - computation maintains state invariant
  - state invariant must hold initially
  - Recursive call transforms one valid state into another
  - result must be obtainable from state invariant (final state)

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

94

## So What is the state for Pow

{Pow 5 3}*	1	(5, 3, 1)
{Pow 5 2}*	(5*1)	(5, 2, 5)
{Pow 5 1}*	(5*5)	(5, 1, 25)
{Pow 5 0}*	(5*25)	(5, 0, 125)

- Technique: **accumulator** for intermediate result

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

95

## State Invariant for Pow

- Consider the computation

$5^3 =$	
{Pow 5 3}*	$5^0$
{Pow 5 2}*	$5^1$
{Pow 5 1}*	$5^2$
{Pow 5 0}*	$5^3$
1 *	$5^3$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

96

## State Invariant for Pow

- The invariant is

$$X^N = \{ \text{Pow } X \ N - i \} * X^i$$

where  $i$  is the current iteration

- Capture invariant with accumulator for  $X^i$

- initially ( $i=0$ )  $1=X^0$
- finally ( $i=N$ )  $X^N$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

97

## So What is the state for Pow

- $(X, N, \text{Acc})$

$$\{ \text{Pow } 5 \ 3 \} * 1 \quad (5, 3, 1)$$

$$\{ \text{Pow } 5 \ 2 \} * (5*1) \quad (5, 2, 5)$$

$$\{ \text{Pow } 5 \ 1 \} * (5*5) \quad (5, 1, 25)$$

$$\{ \text{Pow } 5 \ 0 \} * (5*25) \quad (5, 0, 125)$$

- $(X, N, \text{Acc}) \Rightarrow (X, N-1, X*\text{Acc})$

- Technique: **accumulator** for intermediate result

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

98

## The PowAcc Function

```
fun {PowAcc X N Acc}
  if N==0 then Acc
  else {PowAcc X N-1 X*Acc}
  end
end
```

- Initial call is {PowAcc X N 1}

## The PowAcc Function

```
fun {PowAcc X N Acc}
  if N==0 then Acc
  else {PowAcc X N-1 X*Acc}
  end
end
```

Invariant:  
N-1, thus  
X\*Acc

- Initial call is {PowAcc X N 1}

## How Does PowAcc Compute

```
{ PowAcc 5 3 1 } =  
{ PowAcc 5 2 5 } =  
{ PowAcc 5 1 25 } =  
{ PowAcc 5 0 125 } =  
125
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

101

## The Pow Function

```
fun {PowAcc X N Acc}  
  if N==0 then Acc  
  else {PowAcc X N-1 X*Acc}  
  end  
end
```

- User of Pow wants to actually use Pow proper, not version that requires knowledge on implementation (accumulator)

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

102

## PowA: Complete Picture (PowA)

```
declare
local
  fun {PowAcc X N A}
    if N==0 then A
    else {PowAcc X N-1 X*A}
    end
  end
in
  fun {PowA X N} {PowAcc X N 1} end
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

103

## PowA: Complete Picture (PowA)

```
declare
PowA
local
  PowAcc
in
  PowAcc = fun {$ X N A}
    if N==0 then A
    else {PowAcc X N-1 X*A}
    end
  end
  PowA = fun {$ X N} {PowAcc X N 1} end
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

104

## Pow: Complete Picture (PowB)

```
fun {PowB X N}
  fun {PowAcc X N A}
    if N==0 then A
    else {PowAcc X N-1 X*A}
    end
  end
in
  {PowAcc X N 1}
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

105

## Which Version to Choose

- Which is better: PowA or PowB ?
  - both compute the same
  - both have in common: tight scope
  - which is more efficient?
- Tight scope: PowAcc is visible only to PowA/B
  - program sanity
  - no other program could accidentally use PowAcc
  - as good as a comment: PowAcc belongs to PowA/B!

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

106

## Tight Scope

- Very important way of expressing use
  - avoid clashing identifiers
- Possible only very recently in...
  - C++ “namespace” (took some twenty years)
  - Java “inner classes” (took a major language revision)

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

107

## PowA versus PowB

- PowB creates new procedure value when called
  - unnecessary
  - no external references from PowAcc that use values local to PowB
- PowA better
  - no misinterpretation possible
  - uses less memory (no procedure value created)

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

108

## Pow: Complete Picture (PowB)

```
fun {PowB X N}
  fun {PowAcc X N A}
    if N==0 then A
    else {PowAcc X N-1 X*A}
    end
  end
in
  {PowAcc X N 1}
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

109

## Another Variant PowC

```
fun {PowC X N}
  fun {PowAcc N A}
    if N==0 then A
    else {PowAcc N-1 X*A}
    end
  end
in
  {PowAcc N 1}
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

110

## A Matter of Taste...

- PowC is okay
  - efficiency will be okay
  - is more concise
- Which version you choose is matter of taste
- External references can be useful
  - complicated program structure
  - already large number of arguments

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

111

## Make Pow Even More Efficient

- So far, recursion over integers has been contiguous  
 $n \rightarrow n-1 \rightarrow n-2 \rightarrow \dots \rightarrow 1 \rightarrow 0$
- Idea from the following example:  
 $3^5 = 3 \times 3^4 = 3 \times (3^2)^2 = 3 \times (9)^2 = 3 \times 81 = 243$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

112

## Fast Power Function: Inductive Definition

- Distinguish whether  $n$  is odd or even

$$x^n = \begin{cases} 1 & , \text{ if } n \text{ is zero} \\ (x \times x)^{n/2} & , \text{ if } n \text{ is even} \\ x \times x^{n-1} & , \text{ if } n \text{ is odd} \end{cases} \quad \begin{matrix} (n \neq 0) \\ (n \neq 0) \end{matrix}$$

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

113

## Fast Power Function

```
local
  fun {PowAcc X N A}
    if N==0 then A
    else if {IsEven N} then
      {PowAcc X*X N div 2 A}
    else {PowAcc X N-1 X*A}
    end
  end
in
  fun {FastPow X N} {PowAcc X N 1} end
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

114

## Fast Power Function

```
local
  fun {PowAcc X N A}
    if N==0 then A
    else if {IsEven N} then
      {PowAcc X*X N div 2 A}
    else {PowAcc X N-1 X*A}
    end
  end
in
  fun {FastPow X N} {PowAcc X N 1} end
end
```

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

115

## Question

- Could we again use a nested function definition as we did before for `POWC`?

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

116

## Summary So Far

- Use accumulators
  - yields iterative computation
  - find state invariant
- Exploit structural properties
  - for example:  $x^{2^n} = (x \times x)^n$
- Exploit both kinds of knowledge
  - on how programs execute (abstract machine)
  - on application/problem domain
- External references can be useful
  - for example, second lab assignment

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

117

## What Is Left Unanswered

- Is `FastPow` really faster?
- How much faster is `FastPow` than `Pow`?
- Number of multiplications
  - $\{\text{Pow} \times N\} = N$
  - $\{\text{FastPow} \times N\} \leq \log_2 N$
- How can we determine the runtime...  
...next lecture

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

118

## More on Accumulators

- Accumulators on numbers, fine...
- How about lists?

## Summary

## Summary

- Declarative programming techniques
  - use them, if possible
- Iterative computations
  - typical patterns: IsDone and Transform
  - are efficient (constant stack space)
- Make more computations iterative
  - state invariant and accumulator
- Also use knowledge on problem

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

121

## Have a Nice Weekend

2003-09-19

S. Haridi, CS2104, L06 (slides: C. Schulte, S. Haridi)

122
